

Tindergram Release Summary

Team members

Name	Github Id	The number of story points (or ideal hours for tasks) that a member was an author .
Quinn Hogg	Quinn-of-England	51
William Morin-Laberge	WilliamM-L	87
Nikolas Darlas	steamypotato	65
Mark Zalass	mzal98	68
David Rady	DavidRady	30

Project summary

Tindergram is a secure and extremely user friendly application that allows users to share pictures online and view those posted by individuals that interest them while it also allows them to interact with the media since they can leave comments and likes.

Velocity and a list of user stories and non-story tasks for each iteration

Total: 4 Stories, 54 story-related tasks, 28 non-story tasks, **311 points over 13 weeks**

Iteration 1 (0 stories, 2 non-story tasks, 2 points)

Task #7: Wiki README needs to be updated, 1 point, Status: Done

Task #21: Create README for main project, 1 point, Status: Done

Iteration 2 (1 story with 1 story-related task, 2 non-story tasks, 15 points)

US#10: US - 00: As a user, I want to be able to post pictures on the app so that other users can see them, 1 task, 5 points, Status: Not Complete, Pushed to 3

Task #20: Integrate login functionality with layout, 9 points, Status: Done

Task #25: Write documentation on how to run the app on a physical phone, 1 point.

Status: Done

Iteration 3 (2 stories with 1 story-related task, 5 non-story tasks, 70 points)

US#10: US - 00: As a user, I want to be able to follow other users so that it's easier for me to have access to their content, 2 tasks, 25 points Status: Not Complete, Pushed to 4

US#11: US - 01: As a user, I want to be able to post pictures on the app so that other users can see them, 1 task, 14 points, Status: Not Complete, Pushed to 4

Task #28: Database: A user can login into the app, 9 points, Status: Done

Task #29: Database: Registration, 9 points Status: Done

Task #39: Add Ability for User to Change their Username, Password and Email in the App, 7 points, Status: Done

Task #42: Improve Settings UI for Changing Username, Email or Password, 3 points, Status: Done

Task #45: Add Travis CI and get it working, 3 points, Status: Done

Iteration 4 (4 stories with 50 story-related tasks, 19 non-story tasks, 224 points)

US#10: US - 00: As a user, I want to be able to follow other users so that it's easier for me to have access to their content, 8 tasks, 47 points Status: Done

US#11: US - 01: As a user, I want to be able to post pictures on the app so that other users can see them, 14 tasks, 44 points, Status: Done

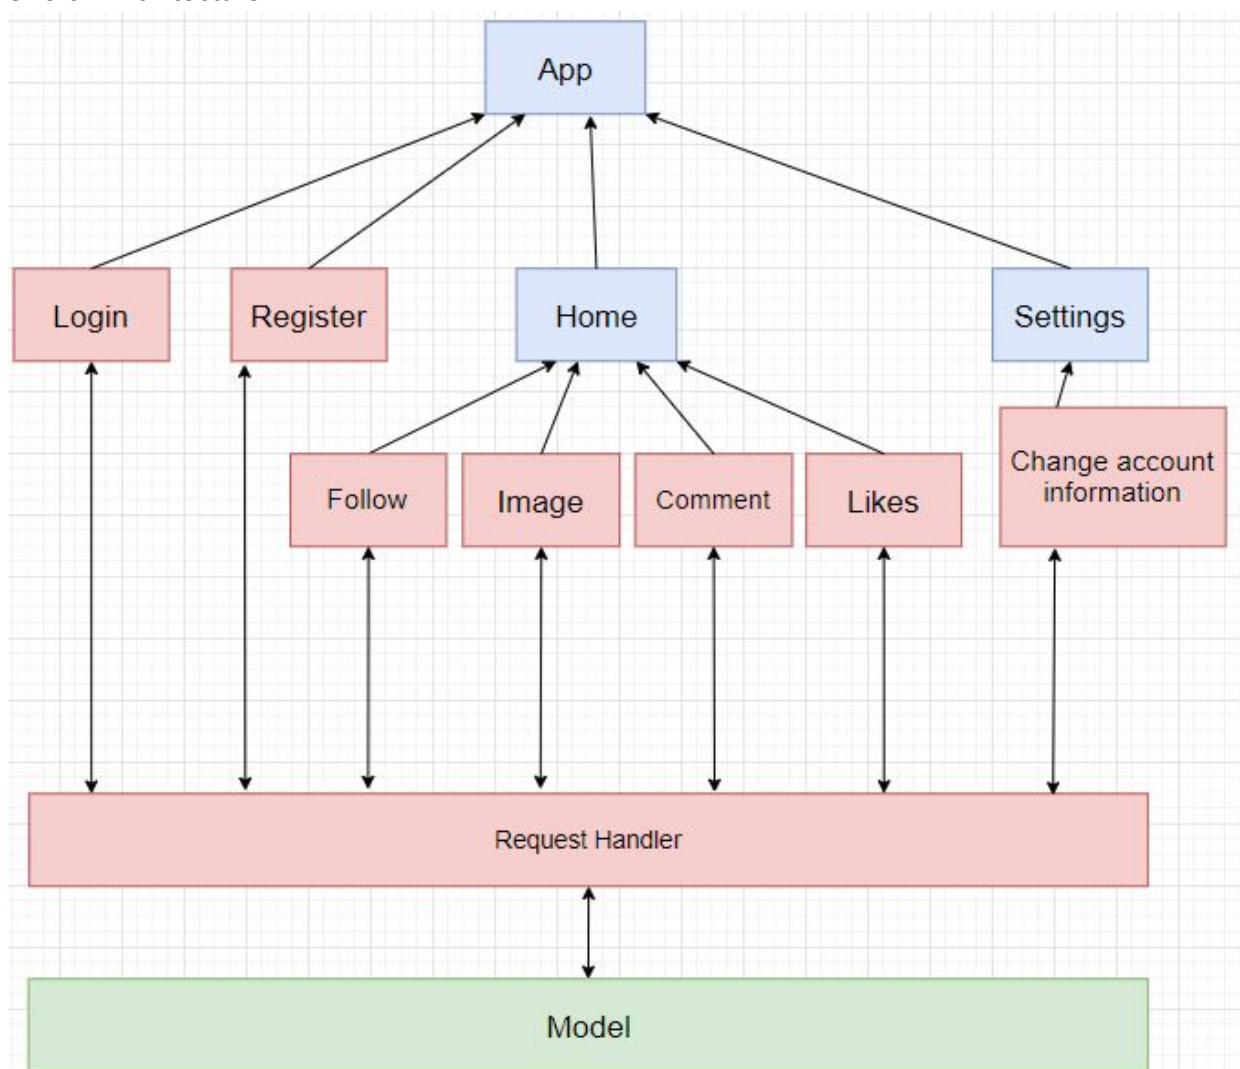

US#13: US - 02: As a user I want to be able to leave a comment on any picture, 8 tasks, 46 points, Status: Done

US#27: US - 03: As a user I want to be able to perform certain actions by swiping while I view pictures, 3 tasks, 20 points, Status: Done

Overall Architecture and Design

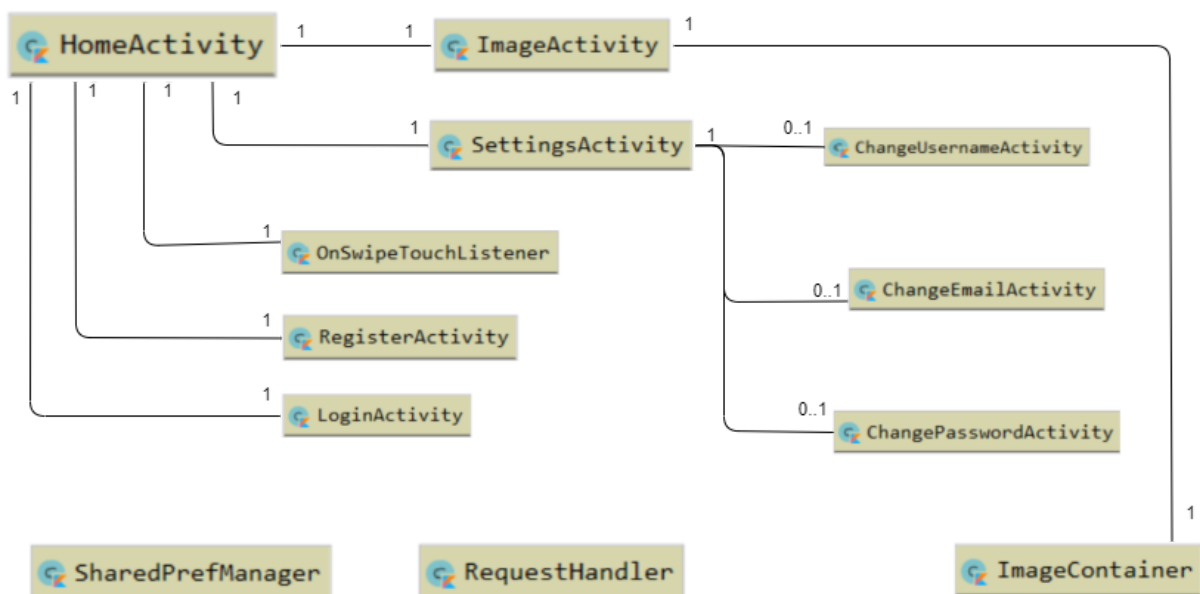

Overall Architecture:

MVC Division:

UML class diagram:

[Link to fully-featured UML diagram with all class members included](#)

Infrastructure

PhpMyAdmin

We are using the software SQL administration tool because it allows us to use php, a language we are moderately familiar with, to write scripts to handle all http requests being sent to the server and then query or update the sql database.

We decided to build our backend this way instead of using some services like AWS or Google Firebase since we wanted to gain some experience working with linux virtual machines, SQL, and handling requests.

MySQL

We use this open-source relational database management system because it interfaces well with php, and it is widely used, making it easier for us to find answers to our questions online.

We could have used noSQL databases, or MariaDB, which is similar to MySQL, but we do not need the extra features provided by other databases given the simplicity of our app. Again, MySQL's history was a deciding factor since we could find much more documentation and many more online resources.

Volley

Volley is a networking library which runs asynchronously on either a caching or network thread. The implicit use of caching threads is what allows Volley to be very fast, as many network requests are simply repeated multiple times within a short period of time.

Furthermore, we can give a network request a callback function for the handling asynchronous response, which is extremely useful for testing purposes.

Retrofit is another network library and popular alternative, however Retrofit does not support caching, which would slow down performance tremendously. In addition. Retrofit does not support image loading capabilities which would be a problem since this app uses images as a baseline.

Naming Conventions

Kotlin:

<https://kotlinlang.org/docs/reference/coding-conventions.html>

Spaces(4) are used for indentation.

Class names use CamelCase notation.

Object names use CamelCase notation.

Variable names use CamelCase notation.

Constant names use uppercase underscore-separated names.

Function names use camelCase notation with lowercase first letter.

PHP:

<https://www.php-fig.org/psr/psr-2/>

Spaces(4) are used for indentation.

File names(except if the file only contains a class), method names follow the camelCase format while class names follow the PascalCase format.

Maximum line length: 120 chars.

Opening braces for classes, methods, loops and if statements go on the next line, and closing braces go on the next line after the body.

The PHP constants true, false, and null are in lower case.

Code

Key files: top 5 most important files:

File path with a clickable GitHub link	Purpose (1 line description)
DbOps.php	All methods that interact with the database.
getBatchImages.php	Sends the pictures the user should see to the app.
HomeActivity.kt	Homepage where all pictures are viewed.
SharedPrefManager.kt	Where information about the user is stored.
VolleyImageRequest.kt	What gets images from the backend using http.

Testing and Continuous Integration

5 most important unit tests with links:

Test File path with clickable GitHub link	What is it testing (1 line description)
CleanUpTest.kt	Used to delete a test user
FunctionalityTest.kt	Basic functionalities test in correct order
RegisterLoginTest.kt	Tests if test user can register and login
SharedPrefManagerTest.kt	Tests if user can change username, email and logout
TestSuite.kt	Tests all above unit tests

5 most important acceptance tests with links:

Test File path (if you automated the test) or as comments in Github issues (if it's done manually) with clickable GitHub link	Which user story is it testing (1 line description)
CleanUpTest.kt	Ability to leave a comment on any picture.
FunctionalityTest.kt	Ability to perform actions by swiping while I view pictures.
RegisterLoginTest.kt	As a user I can post pictures for others to see.
SharedPrefManagerTest.kt	As a user, I want to see the content of people I follow first.
TestSuite.kt	Tests all user stories.

Continuous Integration Environment

[Link to the Travis CI Dashboard](#)

The continuous integration environment used is Travis CI which is linked to the GitHub repo. Travis CI is set to produce a build of the app and run all unit tests after each commit is pushed to the repo and again when a pull request is made. The build of the app and the unit tests must pass for Travis CI to pass the build and approve the commit. Travis CI will first install the required Android SDK files and Gradle, which is used to build the android app and run the unit tests. Once the testing environment is set up, it will then execute a build of the android app using the `./gradlew clean build` command and once the build is successful, it will run the unit tests using the `./gradlew tests` command.

Static Analysis Tool

The static analysis tool used was the Android Studio lint tool. The Android Studio lint tool is an extremely powerful static analysis tool which will give all errors and warnings pertaining to the quality of the Kotlin code and the XML view files, which make up our Android app. The Android Studio lint tool was chosen to produce the static analysis inspection report as it is a built in feature already present in our IDE and is highly regarded for its capabilities. The tool was run by activating it in Android Studio.

Static analysis report included in appendix

Sample of Issues Found

1. file activity_home.xml WARNING Should use ""sp"" instead of ""dp"" for text sizes
 - ◆ This warning indicates that the density independent pixels "dp" unit was used to denote font size for text in the activity_home.xml file instead of the scale-independent pixels unit "sp".
2. file activity_home.xml WARNING Hardcoded string "Post", should use '@string' resource
 - ◆ This warning indicates that a string was hardcoded in the text of the Post image button instead of referenced from the strings.xml file.
3. file FollowTests.kt WARNING Unnecessary non-null assertion (!!) on a non-null receiver of type MutableMap
 - ◆ !! (non-null assertion) indicates that null is not a valid input for the method. MutableMap does not accept null as a valid input so !! is redundant.
4. file SharedPrefManager.kt WEAK WARNING Private property name 'PREF_NAME' should not contain underscores in the middle or the end
 - ◆ Linter flagging variable name as not following naming style guide, although in Kotlin the convention for constants is to be in all caps and underscores.
5. file HomeActivity.kt WARNING Explicitly given type is redundant here
 - ◆ MutableMap declared as <String, String>, redundant
6. file SharedPrefManager.kt WARNING Unused import directive
 - ◆ Library imported that was never used.
7. file SharedPrefManager.kt INFO Property 'sharedPref' could be private
 - ◆ sharedPref member could be private as only accessed in the class
8. file HomeActivity.kt WARNING Variable is never modified and can be declared immutable using 'val'
 - ◆ Var variable never modified, could be declared as constant val
9. file RequestHandler.kt WEAK WARNING 'rangeTo' or the '..' call should be replaced with 'until'
 - ◆ 0..*size*-1 in for loop could be replaced with 0 *until* size
10. file HomeActivity.kt WARNING Property "ifLiked" is never used
 - ◆ *ifLiked* boolean declared but is never used
